AlphaGrep Securities — Core Engineering Hiring Team
AlphaGrep Securities
India

Re: Software Development Intern — Core Engineering

Dear Hiring Team,

I am applying for the **Software Development Intern** role on AlphaGrep's **Core Engineering** team. I am a penultimate-year **B.Tech Artificial Intelligence** student at SVNIT Surat (CGPA **9.20/10**, graduating **May 2028**), with a computer science foundation in **data structures, algorithms, object-oriented design, operating systems, and computer networks**. I build software with a performance-first mindset and am drawn to AlphaGrep's work on **robust, extremely fast** proprietary trading systems—where engineering discipline, latency awareness, and clear communication matter as much as raw problem-solving ability.

My strongest systems work is in **C++**. On **OA Forge**, I built a hybrid **C++17** online-assessment judge: local **g++** compilation with **-O2**, subprocess sandboxing, STL-based test harness generation, and automated verdict pipelines over **14K+** evidence-tracked question occurrences and **5.5K+** test cases. This maps directly to designing, developing, and testing proprietary tooling under real constraints—correctness, speed, and maintainability. I implement contest-style problems primarily in **C++** (LeetCode Knight, rating **2048**, **711+** solved; Codeforces Specialist, rating **1419**, **252+** solved), and I am comfortable reasoning about memory, I/O, and implementation trade-offs under time pressure.

On **LogiFlow** (Google Solution Challenge 2026 Global Top 106), I co-led backend work on large-scale operational data—**15,650 train-day** records across **9,526 stations**—and engineered **latency-aware** read paths (**100–400 ms**) using Redis caching and modular service design. I built a Gradient Boosting delay **simulator** with a **100/100 pytest** regression suite, separating hot data access from heavy compute in a way that parallels simulation and analytics pipelines in trading infrastructure. At IFFCO, I designed, developed, and tested production services on **Linux** (Docker, CI/CD), built **10+ RESTful APIs** with optimized SQL, and collaborated with cross-functional stakeholders across the full SDLC. On **AirHelp** (PowerMind Hackathon 2026), I shipped **real-time WebSocket** services and tuned **1–3s** response latency under **50–100 concurrent** connections.

I bring coursework and project exposure to **network programming, concurrent and real-time systems, distributed computation, and computational intelligence**, along with genuine interest in **financial markets** and systematic trading. I would welcome the opportunity to learn from AlphaGrep engineers, contribute to low-latency core systems, and grow within a team that values brilliant problem-solving and precise implementation.

Thank you for your consideration.

Sincerely,
Ojas Srivastava
