Payoneer WFM Hiring Team
Payoneer

Re: Software Intern

Dear Hiring Team,

I am applying for the Software Intern role at Payoneer WFM. I am a penultimate-year B.Tech Artificial Intelligence student at SVNIT Surat—a Tier-1 NIT—with CGPA 9.20/10, graduating May 2028. Your posting describes exactly how I work: strong DSA and first-principles problem solving first, production code that survives review second, and AI-assisted tools as a multiplier—not a substitute for clear thinking.

On fundamentals: I am a LeetCode Knight (2048, 711+ problems solved, 32 contests) and Codeforces Specialist (1419, 252+ solved). I pick data structures and complexity targets before I write code, whether that is a whiteboard problem or a production feature. That discipline shows up in my projects, not just on contest profiles.

On shipping: at IFFCO I built production Node.js, Express, and MySQL services—automating 50+ daily workflows and 10+ REST APIs with JWT auth, validation, Docker, and CI/CD. I debugged real issues from stack traces and logs, incorporated mentor feedback in code review, and deployed only after tests passed. On LogiFlow (Google Solution Challenge Global Top 106), I co-led backend on GCP Cloud Run with Redis-cached reads at 100–400 ms, a 100/100 pytest regression suite, and documented APIs so the next engineer can move fast.

On AI—responsibly: I built AirHelp with RAG and ChromaDB, and Community Hero with Gemini API integration—both deployed, both with guardrails for when AI helps and when it does not. I use Cursor daily, but I reason through architecture, invariants, and edge cases before reaching for an LLM. Auth boundaries, production data, and anything I cannot defend in review are where I think first and automate second.

Payoneer powers global payments for businesses; that requires the same reliability mindset I learned in enterprise production—clear error handling, reviewable code, and ownership through completion. I want an internship where I build features end-to-end, give and receive code reviews, and grow with senior engineers who hire for sharp minds, not long resumes.

Thank you for your consideration. I would welcome the opportunity to discuss how I can contribute.

Sincerely,
Ojas Srivastava
