

GE HealthCare — Interview Cheat Sheet

Prepared for Ojas

After HomeHub

Software Intern · Bengaluru · Short desk reference

Where you are: HomeHub (ADEPT-15 + games) is done. Next is usually live interviews — technical, then manager/HR. Order can vary by role. Treat HR seriously — people clear tech and fail HR.

1. Likely rounds after HomeHub

Round	Time	What to expect
Technical	30–75 min	Intro → resume/projects deep-dive → DSA logic and/or OOP → OS/DBMS/CN. Panel-dependent: mostly logic; sometimes live code.
Manager	30–45 min	Why GE, projects ownership, hobbies, culture fit, GE website research.
HR	15–30 min	Why GE, products, competitors, relocate to Bengaluru, teamwork STAR, other offers.
HireVue (if scheduled)	~5 Qs	Recorded. 30–60s think, 3 attempts. Intro / why GE / strength / challenge.

2. 60-second scripts (say out loud once)

Intro

I'm Ojas Srivastava, B.Tech AI at SVNIT Surat, CGPA 9.20. I've shipped production APIs as a Software Engineering Intern at IFFCO (Node/Express/MySQL), and co-led LogiFlow — a multi-modal logistics platform that reached Google Solution Challenge Global Top 106 — with FastAPI, Redis, and GCP Cloud Run. I also built Community Hero (Vibe2Ship Global Top 20) end-to-end. I'm a LeetCode Knight (2048). I'm excited about GE HealthCare because I want to build software where reliability and patient impact actually matter — and I'm ready to work on-site in Bengaluru.

Why GE HealthCare?

GE HealthCare sits at engineering + patient outcomes. Software here has to be reliable, tested, and maintainable — that matches how I work: APIs with validation, unit/integration tests, CI/CD. The intern role in Bengaluru is a chance to contribute to real healthcare products under senior engineers, not just demos.

Why healthcare / why this role?

Healthcare software must fail safely. That discipline appeals to me — clear requirements, testing, ownership. I've already owned design → deploy → maintain on production systems; I want that same ownership inside medical technology.

Challenge (STAR)

S: At IFFCO, production APIs needed reliability under real load.

T: Own debug + quality for 10+ APIs.

A: Added indexing, validation, structured errors; wrote tests; worked with seniors on requirements.

R: More stable ops path + clearer maintainability — same habits I used on LogiFlow (100/100 business-rule tests).

3. Drive tech toward your strengths

IFFCO internship

- 10+ production APIs — Node/Express/MySQL
- Indexing, validation, error handling
- Code reviews, Docker, CI/CD
- Cross-functional with seniors

LogiFlow (Top 106)

- FastAPI + C++ + Next.js + Redis
- GCP Cloud Run modules
- Hot-path latency 100–400 ms
- 100/100 pytest business rules

Community Hero (Top 20)

- Full ownership: design → deploy
- React/TS + Express + Firebase
- REST + admin analytics + Cloud Run

AirHelp

- WebSockets + RAG + A*
- Latency cut to 1–3s under load
- Real-time debugging story

Project drill (any project): workflow → architecture (client→API→DB) → auth → one hard bug → how you'd test → what you'd change at scale. If asked to "design testing software": unit → integration → E2E; pytest; mock DB; CI on push; regression before release.

4. CS flash — one-liners

OOP

- 4 pillars: encapsulate, inherit, polymorph, abstract
- Overload = compile-time; override = runtime
- Virtual/override for runtime polymorphism
- May ask: implement polymorphism live

OS

- Process vs thread; mutex vs semaphore
- Deadlock: 4 conditions; race → locks
- Paging / virtual memory basics

DBMS / SQL

- ACID; 1NF–3NF; PK/FK; index tradeoff
- INNER vs LEFT JOIN
- 3rd highest salary: `ORDER BY ... LIMIT 1 OFFSET 2`

CN / System

- OSI 7 layers; TCP vs UDP; 3-way handshake
- DNS, DHCP; REST + JSON
- 3-tier: UI → business → data

5. DSA — patterns they actually ask

Area	Prep these
Arrays	Two Sum (hash), Kadane, prefix, merge intervals, stock buy/sell
Strings	Anagrams, valid parens, first unique char, longest substring
LL / Trees	Reverse LL, cycle; level-order BFS, leaf sum, BST insert
OOP twist	Wrap Easy DSA in a class/method (Two Sum, leaf sum) — reported for EID

Mostly logic + approach. Still know C++/Python syntax for surprise live coding. Warm up: One Easy + Kadane dry-run.

6. HR / manager must-know

Question	Crisp answer angle
GE products?	Imaging (MRI, CT, ultrasound), patient monitoring, Edison platform — "software that clinicians rely on."
Competitors?	Siemens Healthineers, Philips Healthcare (high level is enough).
Relocate Bengaluru?	Yes — already stated on resume; ready on-site.
Teamwork?	ACM/Nexus mentoring + LogiFlow co-lead — task split, syncs, demo.
Strength?	Ownership under deadlines + testing mindset (production APIs + pytest).
Weakness?	One real growth area + what you changed (e.g. over-polishing → time-box + ship).
Other offers?	Honest; GE is priority for healthcare impact + Bengaluru engineering.

Ask them (pick 1–2): What does a successful Software Intern look like in the first 4 weeks? · Which product/team would I likely join? · How do interns get code-review / testing mentorship?

7. Day-of checklist

- ☐ Quiet room, charged laptop, stable Wi-Fi
- ☐ Resume PDF + GitHub + LeetCode open
- ☐ Speak: intro + why GE once out loud
- ☐ Think aloud; ask clarifying Qs

- ☐ LogiFlow / Community Hero live URLs ready
- ☐ Camera eye-level, collared shirt

- ☐ Drive to IFFCO APIs / LogiFlow / testing
- ☐ Take HR as seriously as tech

Rule: Consistent personality (same as HomeHub). Don't invent GE product depth — 2–3 facts + genuine curiosity beats a fake encyclopedia.
