Hiring Manager

Goldman Sachs

Engineering Division — Summer Analyst Program 2027

Bengaluru / Hyderabad, India

Dear Hiring Manager,

I am writing to apply for the Summer Analyst position in Engineering at Goldman Sachs. I am a first-year B.Tech student in Artificial Intelligence at SVNIT Surat (NIT Tier-1), maintaining a CGPA of 9.19, with a LeetCode Knight rating of 2005 and 600+ problems solved. My background spans production-grade backend systems, real-time distributed data pipelines, and AI-integrated applications — and I am looking to bring that depth into a team that builds infrastructure at the scale and correctness demands of Goldman Sachs.

My most significant project is LogiFlow, built for the Google Solution Challenge 2026: a multi-modal cargo logistics optimizer (Road/Rail/Air/Water) that uses a Gradient Boosting ML delay prediction engine, Redis caching, and Pareto dominance scoring to rank routes by time, cost, and risk in real time. The problem of normalizing heterogeneous data sources and making optimal decisions under competing constraints is directly analogous to the kind of work Goldman Sachs engineers do in trading systems and risk platforms. I also built AirHelp at PowerMind Hackathon 2026 — a privacy-first AI airport assistant featuring a RAG pipeline (ChromaDB + Sentence Transformers), A* graph-based navigation, WebSocket real-time alerts, and a 3-layer conversation memory architecture, all designed for fault tolerance and low latency.

As a Software Engineering Intern at IFFCO, I designed and deployed 10+ RESTful APIs in a live production environment, set up Docker-based containerization and CI/CD pipelines, and collaborated directly with senior engineers on architecture decisions — shipping code that eliminated manual processing for 50+ daily operations. I also serve as Technical Lead at Inspectonly.devs, Executive Member at ACM SVNIT, and mentor junior students in DSA and systems through Nexus SVNIT.

Goldman Sachs Engineering is where I want to develop because the problems your teams solve — massively scalable software, low-latency infrastructure, and turning real-time data into action — are precisely the problems I am most motivated by. I am a fast learner who builds things that work reliably under pressure, and I am excited by the opportunity to grow as an engineer inside a firm that operates at this level of scale and consequence.

Thank you for considering my application. I would welcome the chance to discuss how my skills and projects align with the work your engineering teams are doing.

Sincerely,

Ojas Srivastava
