Graviton Research Capital — Quantitative Research Hiring
Quantitative Research Intern (2028 Graduates)
Gurugram, Haryana, India

Re: Application for Quantitative Research Intern — 2028 Graduates

Dear Hiring Team,

I am applying for the Quantitative Research Intern role for 2028 graduates in Gurugram. I am a penultimate-year B.Tech Artificial Intelligence student at SVNIT Surat (CGPA 9.20/10, graduating May 2028), with coursework in probability and statistics, linear algebra, and machine learning, and strong programming skills in Python and C++. What draws me to Graviton is the idea that trading edges begin as research questions—curiosity, statistical rigor, and evidence over instinct—and that an eight-week internship can mean owning work that is evaluated against real markets, not observed from the sidelines.

My strongest research-style project is LogiFlow (Google Solution Challenge 2026 Global Top 106). I treated delay prediction as an open-ended research problem: formulated the hypothesis, engineered features from timetable, route, and history on 15,650 train-day records, and built Gradient Boosting models evaluated with cross-validation (MAE 22.7 minutes; 81% of predictions within 30 minutes). I iterated on experimental design, built a 100/100 automated validation suite, and shipped analytical tooling for ranking and explainability—practice moving from question to model to measured outcome. Separately, I have invested in Indian equities and mutual funds for over three years and write Python tooling for portfolio logging, attribution, and screening; that habit of testing ideas against data is how I prefer to think about markets.

I am comfortable working with large structured datasets, writing clean Python for analysis and modeling, and communicating technical results clearly (ACM SVNIT executive; Nexus mentor). Competitive programming (LeetCode Knight, rating 2048; Codeforces 1419) keeps my problem-solving sharp when the first approach is wrong. I would be excited to spend eight weeks at Graviton contributing to predictive research, learning from quantitative researchers and technologists, and holding myself to the standard that success means a complete project from hypothesis through evaluation.

Thank you for your consideration. I would welcome the opportunity to discuss how I can contribute.

Sincerely,
Ojas Srivastava
