

GEP campus interviews — what people were asked

Public candidate write-ups, quoted round by round. No invented questions.

How to read the labels.

Confirmed — shows up across several independent reports. **Repeated** — two or more reports, campuses differ. **One-off** — a single post. Useful, not a promise.

Everything below is what a real candidate said they were asked. Where a report is paywalled or vague, it says so instead of guessing.

1. Official process (GEP campus, India)

- Sequence: **PPT** → **OA** → **2 technical rounds** → **HR**. **Confirmed**
- Process closes fast — results typically in **1–2 days**.
- Offices: **Mumbai** (CJB / Airoli) and **Hyderabad** (Madhapur).
- Internship length: **8–10 weeks**.
- A fail carries a **6-month cooling period**.
- Both **Technology intern** and **Technology AI** tracks exist.
- Source: gep.com campus connect, India.

2. Sarthak Chauhan — SVNIT, GEP intern → PPO

OA. Aptitude + maths + MCQs + **2 medium DSA** problems.

Technical 1.

- **Tell me about yourself.**
- **Explain the pillars of OOP** — with heavy follow-up on **polymorphism and inheritance**, and he was pushed for **real-world examples** of each, not textbook definitions.
- Deep dive on his finance-manager project, specifically **how did you do login and authentication?**

Technical 2.

- **What is your favourite data structure?** He said **trees** — and then got a long grilling on tree internals and traversals.
- **Give a real-world problem you solved with a tree** — he answered with **BFS / level-order**.
- A **divide-and-conquer** puzzle.

HR. What are your hobbies? Are you willing to relocate to Mumbai?

Most relevant report in this document — same college, same role.

3. Shivam Kumar — campus SDE 2025, ex-GEP intern

Format. 2 technical rounds + HR.

Each technical round. One **Easy–Medium DSA** problem (arrays or graphs) plus a **deep project discussion**.

Key point he stressed. Every question came out of **his own intro, his own code, and his own resume**. They probe **internals**, not hard competitive programming.

Timeline. Offer in roughly **3 days**.

Confirmed — matches the Sarthak and GFG reports on "questions come from your resume."

4. GeeksforGeeks — Intern, on-campus

OA.

- Aptitude with image-based questions.
- **SQL**, including a **conflict-resolution** question.
- Coding: **find the number of seconds between two given times**.
- Roughly **25 of 70** cleared.

Technical 1 (about 22–25 minutes).

- Find the first non-repeating character in a string.
- Remove the repeating characters and print the result.
- What difficulties did you face in your project?

Technical 2 (about 10 minutes — short round).

- What is the purpose of OOP?
- Difference between data structures and algorithms.
- How would you know what language a website is built in, without reading its code?
- Where do you see yourself in 5 years?

HR. What do you know about GEP? How did you apply? What is your future goal?

One-off — that same post claimed everyone who reached HR got the intern offer. Treat that as one campus's outcome, not a rule.

5. GeeksforGeeks — SDE

OA — 90 minutes, 4 sections.

- Logical reasoning.
- Fast maths: simple interest, profit and loss, data interpretation.
- OS + DBMS.
- One **medium** coding problem.

Technical 1 (about 1 hour).

- **OOP for the first 10 minutes**.
- **MongoDB** questions — purely because Mongo was on his resume.
- His **ML project** for about 15 minutes.
- An array DSA problem **solved using a map**.
- A puzzle.

Technical 2 (about 40 minutes).

- More depth on the ML project.
- **Print Fibonacci numbers in a given range — now do it a second way. Two methods demanded.**

HR. Why are you shifting from data science to software? Family background. Location preference.

Confirmed — resume-driven grilling and "solve it another way" both recur.

6. GeeksforGeeks — SDE-1, on-campus (around 2020)

OA — quoted problem. N people have chocolates; you pick a range; the boxes must be divisible by M; maximise the number per box.

Technical 1.

- Algorithms used during his internship.
- Full project discussion.
- **Design Zoomcar** — 10 to 15 minutes of system design.

Technical 2 — the OOP-heavy round.

- **Abstraction vs abstract class vs encapsulation.**
- **Friend** keyword. **Static** keyword.
- **Design a bank using OOP.**
- **Two users grab the last item in a cart at the same time — what happens?** (race condition)
- Puzzle: **12 balls, one faulty** — find it.
- Puzzle: **two buckets**, measure a required quantity.

HR — short. Family. College. Location. Expectations.

7. GeeksforGeeks — Associate Software Developer

OA. 15 questions on **C# / Angular / .NET**, plus one coding problem:

Alt+Tab behaviour — given $n = 4$ and the list $\{1, 2, 3, 4\}$ with $k = 3$, output $\{3, 1, 2, 4\}$. Must handle the case where $k \geq n$.

Technical 2 — he called this the toughest round.

- His project: **AJAX, jQuery, MVC**.
- Timetable **database** design.
- **Why is main public?**
- **Why String[] args?**
- **Complexity of BFS.**

One-off on the stack — the C#/.NET section is for the associate developer role, not the AI/technology intern track.

8. TalentBattle — ASE, Airoli, 2023

Technical.

- Introduce yourself. Internships you have done.
- OOP concepts. **Access specifiers.**
- **Stack vs queue vs list vs tree.**
- **Find the middle of a linked list.**
- **Binary search.**
- **Print prime numbers from 1 to 100.**
- **Time complexity of sorting algorithms.**
- **Python vs Java.**
- **MySQL vs MongoDB.**
- **Primary key vs foreign key.**

HR. Family. Goals. What do you know about GEP. Interests. Schedule / availability. Strengths and weaknesses. Favourite subject.

Confirmed — this is the single best list of the "small, fast, fundamentals" questions.

9. Maanya Jain — AI Intern, Thapar 2024

Sequence. PPT → OA → Preliminary → Functional → HR.

OA. Time and space **complexity**; **Python** error-spotting; **SQL**; **Hadoop**; one **medium DSA** problem.

Shortlist. 12 candidates.

Interviews. The write-up is **paywalled**. The actual interview questions are not public — nothing is reconstructed here.

Closest AI-track report — the OA content is real, the interview content is unknown.

10. Sanjay Gupta — 2023

Intern role was based in **Mumbai**; the full-time role could be **Mumbai or Hyderabad**.

Confirms **Hadoop MCQs** appearing on the OA.

Repeated — Hadoop on the OA also shows up in the Thapar AI report.

11. AmbitionBox — aggregated

Software Engineer, most-quoted question: **Explain the key projects you have implemented.**

Full-time SE stack questions skew to **C# / Angular / SQL**.

Caution. The consulting guesstimate questions on AmbitionBox belong to GEP's consulting loop. They are **not** part of this technology intern process.

12. What this means for a 2026 Technology intern

There is **no public 2026 question dump** for the combined SE + AI intern loop. Nobody has posted it. Anything claiming otherwise is invented.

What the reports agree on, for **two rounds after the OA**:

- **Your resume is the question bank.** Mongo on the resume → Mongo questions. ML project on the resume → 15 minutes of ML. Do not list what you cannot defend.
- **OOP is near-guaranteed** in at least one round — pillars, polymorphism and inheritance with real-world examples, abstraction vs encapsulation, access specifiers, static.
- **One Easy–Medium DSA per round**, usually strings, arrays with a hashmap, linked list, or a BFS-flavoured graph problem. Not hard competitive programming.
- **"Now solve it another way"** is a live pattern — Fibonacci two ways is quoted directly.
- **A puzzle** is common in round 2: divide and conquer, 12 balls, two buckets.
- **"What is your favourite data structure?"** is a trap — whatever you say becomes the next 10 minutes.
- **HR is short and predictable**: what do you know about GEP, family, location, hobbies, 5-year goal, strengths and weaknesses.
- **Rounds can be short.** One report had a 10-minute second round. Answer fast and completely; do not wait for a long runway.
