

GEP Intern – Technology: Prep Roadmap

FINAL — do not revise; only execute

Ojas Srivastava | SVNIT Surat | Batch 2028 | Hyderabad / Mumbai | Rs. 50k/mo

Companion (questions & links): GEP_Question_Practice_Roadmap.pdf

1) Freeze note & sources

- Process: PPT → OA → Tech → Functional → HR
- Resume: ojas_srivastava_gep_technology_intern.pdf
- Sources merged: **Sudhanva Bharadwaj BM** (Summer 2026 intern), LeetCode Summer Intern 2026 write-up, Harsh Khulbe, Sarthak Chauhan, GFG campus posts
- Interviews **vary** — prepare patterns below; do not chase new Google tabs

2) OA — what to expect

AI MCQs (MAJOR) ~12–20 Q. Intro only: AI/ML/DL vocab, where CV / RL used, linear regression idea. Coursera-level. **Do not overstudy.**

Core CSE MCQs Mostly **OS + DBMS**. Also be ready for OOP/SQL style.

Coding 1 LC-**Easy**: strings, hashing; STL / language basics.

JavaScript Code provided — **fill in the blanks** / complete the task.

Also possible Aptitude + soft-skills (other campus variants / iMocha packs).

3) Subject priority (execute in order)

#	Subject	Focus	Pri
1	AI intro MCQs	Use-cases + vocab — not math	MUST
2	OS + DBMS	OA MCQs	MUST
3	Named algos + Easy DSA	By name and code (not only Kadane)	MUST
4	JS fill-in	Read snippet; finish blanks	MUST
5	Resume projects	Every term → 2–3 layers deeper	MUST
6	OOP + SQL JOIN	Tech rounds / other write-ups	MUST
7	Aptitude / SJT	If your OA variant has them	SHOULD
8	GEP + location + HR	Pitch; Hyd/Mum #1; confident tone	MUST

4) Day sprint (run this once)

Day 1 AI MCQs once (practice doc). OS + DBMS quizzes. OOP pillars spoken <2 min.

Day 2 Named algos flash (Sec in practice doc). Code: Kadane, Binary Search, BFS + dry runs. Strings/hashing Easy. JS quiz + fill-in.

Day 3 Project depth: IFFCO, LogiFlow (+SSR), Community Hero, AirHelp — impact + your role. SQL JOIN by hand.

Day 4 Mock OA sitting: AI + OS/DBMS feel + 1 Easy + JS blank. Proctoring ready (cam, no tab switch).

Day 5 Functional/HR answers; location locked; one good question for them (agents / large data).

Drive Sleep; revise ticks only; print resume; warm-up 2 Easy + speak one named algo.

5) Interview playbook

R1 — DSA / peer-style tech

- Clarify → approach → code → dry-run → edge cases; **never silent**
- May ask algo **by name** (Kadane, BFS/DFS, Binary Search, Dijkstra idea, Merge/Quick...)
- Sudhanva got only Kadane — treat as sample, not syllabus

R2 — Projects

- Resume deep-dive or “describe your projects”
- Own your role + impact; open-source first if any; best projects next
- Every buzzword you say must survive 2–3 follow-ups

Close + HR

- Ask something real (scale / AI agents / their stack)
- HR: confident, clear; location preference ready; layman project pitch

Difficulty note

- FTE sometimes got B-Tree / Red-Black — unlikely for interns; skip unless on resume

6) Company one-liners

- GEP: AI-powered procurement & supply chain — software + consulting + managed services
- Products: Quantum Intelligence, SMART, NEXXE (Azure SaaS)
- Open to learning Angular / .NET if asked

7) Anti-fail (final)

- No more research tabs; no hard CP grind for OA; no silent coding; no resume lies
- AI section: calm intro MCQs only — do not spiral into ML theory

8) Ready bar

- ☐ AI MCQs once ☐ OS/DBMS quizzes ☐ Named algos spoken
- ☐ Kadane + BS + BFS coded + dry-run ☐ JS fill-in ☐ Projects deep
- ☐ Mock OA once ☐ Location + end-question + HR pitch
