Education

- **Sardar Vallabhbhai National Institute Of Technology** Surat, Gujarat Pursuing Bachelor's of Technology in Artificial Intelligence August 2024 – May 2028

Skills & Frameworks

- **Programming Languages:** Python, C, C++
- **Web Development:** HTML, CSS, JavaScript
- Machine learning
- Data science
- **Framework:** Django

Projects

- **PIR-Based LED Control System[Arduino Uno]:** I built a small detection system that identifies humans and animals based on changes in infrared rays. The main components used in this project include an IR sensor, an Arduino Uno, jumper wires, and an LED. The coding for this project was done using the Arduino IDE with the C++ programming language. The IR sensor detects changes in infrared rays, which in turn controls the LED.
- **Line following robot[Arduino Uno]:** Designed and built an autonomous line-following robot using an Arduino kit and infrared sensors to detect and follow a white path on a black surface. Implemented real-

time directional adjustments based on sensor input. Collaborated with teammates to assemble and wire the motor driver circuit.

- **general store website[HTML, CSS, JAVASCRIPT, DJANGO]:** I developed a user-friendly Grocery Store web application tailored for college students, enabling them to conveniently order daily essentials from both the general and medical stores located on the SVNIT campus. The platform streamlines the ordering process, allowing students to receive their items quickly while benefiting from exclusive student discounts. Notably, the service operates without any platform charges or delivery fees, making it an efficient and cost-effective solution for campus residents.
