B.Tech Artificial Intelligence, SVNIT Surat | CGPA **8.75**/10 | 2024–28

Target: GE HealthCare — Edison Internship Development (EID) 2027 | **Software (SW)**

SUMMARY

Second-year **B.Tech Artificial Intelligence** student at **SVNIT Surat** with strong foundations in **C/C++**, **Python**, **object-oriented design**, and **data structures & algorithms**. Designs, develops, tests, and debugs full-stack software end-to-end — from requirements through deployment — using **Python**, **JavaScript/TypeScript**, **FastAPI**, and **Next.js**. Hands-on with applied **ML**, real-time streaming, and decision-intelligence features on a live multi-modal logistics platform (**Google Solution Challenge 2026**). Seeking the **GE HealthCare EID Software** internship to contribute to reliable healthcare-technology software and grow toward the **Edison Engineering Development Program (EEDP)**.

EDUCATION

Sardar Vallabhbhai National Institute of Technology, Surat

2024–28

Bachelor of Technology — Artificial Intelligence

CGPA: **8.75**/10

- **Relevant coursework:** Data Structures & Algorithms, Object-Oriented Programming, Operating Systems, DBMS, Software Engineering, Machine Learning
- **Focus:** analytical problem-solving, clean software design, and shipping production-style modules with version control (Git)

EXPERIENCE

Artificial Intelligence Intern

Mar–Apr 2025

Personify

Remote

- Designed, trained, and **evaluated** TensorFlow models for text classification, object detection, and pet-face classification — owned preprocessing through measurable outputs.
- Implemented landmark detection for key visual features; practiced systematic debugging and iteration on model quality.
- Collaborated in a fast-paced remote team; documented experiments and communicated tradeoffs clearly to mentors.

TECHNICAL PROJECTS

LogiFlow — Multi-Modal Logistics Decision Platform

Google Solution Challenge 2026

*Python, FastAPI, TypeScript, Next.js, SSE, Redis, GCP / Vercel | **GitHub** / **Live***

Full-stack decision-intelligence platform that compares road, rail, air, water, and hybrid cargo routes with priority-weighted scoring and Pareto ranking.

- Owned **Route Composer**, **SSE streaming**, and decision-intelligence flows — design through debugging of chained multimodal itineraries and live progress updates.
- Built full-stack modules that normalize multi-pipeline outputs into one schema; supported ranking for cheapest / fastest / safest picks with plain-language AI explanations.
- Practiced software lifecycle habits: feature scoping, API contracts, integration with Cloud Run / Vercel deploy paths, and clear technical documentation for the team.

EasyBook — Movie Ticket Booking Platform

Live

MongoDB, Express.js, React.js, Node.js (MERN)

- Developed end-to-end booking flows (browse, seat selection, auth) with responsive UI and structured page navigation.
- Demonstrates OOP-style modular frontend/backend separation, session-aware user flows, and production deploy on Vercel.

Beneath The Blue — Interactive Conservation Platform

Web Wonder Finalist

*Interactive web modules | **Live***

- Built Posts, Explore, Species, Threats, Community, and Quiz modules with navigation and pledge/feedback action flows.
- Recognized as **Finalist** at Web Wonder — teamwork, delivery under deadlines, and demo-ready software quality.

TECHNICAL SKILLS

Languages (OOP focus): C/C++, Python, JavaScript, TypeScript, HTML/CSS

Core CS: Data Structures & Algorithms, Object-Oriented Design, Debugging, Problem Decomposition

Frameworks & Backend: FastAPI, Next.js, React.js, Node.js, Express.js, Django

Data & Infra: MongoDB, Redis, REST APIs, SSE streaming, Git/GitHub, Vercel, Render, GCP Cloud Run

ML / Analytics: TensorFlow, data preprocessing, model training & evaluation, decision-intelligence scoring

Interests: Reliable software systems, full-stack engineering, applied AI, **healthcare technology software**

ACHIEVEMENTS & LEADERSHIP

- **Google Solution Challenge 2026** — LogiFlow (Neural Foundry); role: full-stack ð route composer ð SSE ð decision intelligence
- **Finalist**, Web Wonder Competition — *Beneath The Blue*
- Core Member, Bureau of Indian Standards (BIS) Student Chapter, SVNIT Surat — campus standards awareness and chapter delivery

Venu S — Findings

Staff Test Engineer

Automation

Java / Selenium

Healthcare domain

No public interview reviews name **Venu S**. How he will interview is **INFERENCE FROM ROLE**, not a leak. Do **not** mention his LinkedIn or tools list in the call.

Staff Test Eng.

GEHC NOW

Jul 2023 →

AT GE HEALTHCARE

Java + Selenium

AUTOMATION CORE

Healthcare

+ BANKING/FINANCE PAST

1. Confirmed facts

Item	Detail
Name / handle	Venu S · linkedin.com/in/venu-s-89992748
Current role	Staff Test Engineer , GE HealthCare, Bengaluru (Jul 2023 → present)
Headline	Test Staff Engineer at GE HealthCare; automation expert (banking/finance + healthcare)
Prior	Sr Software Test Engineer, Siemens (Aug 2021 – Jun 2023)
Prior	Sr Software Test Engineer, Siemens Healthineers (Jun 2018 – Jul 2021)
Earlier	Automation Test Engineer, Capgemini (Jun 2017 – May 2018); Automation Engineer, TCS
Tooling he names	Selenium, Itko Lisa (service/API automation), Squish ; Core Java; JUnit, Cucumber, TestNG; data-driven frameworks built from scratch
Public reviews of him as interviewer	None found

Mental model (different from an architect panel). You are talking to a senior *quality / automation* engineer who has spent a decade making sure software fails safely before it ships — including years in medical-tech (Siemens Healthineers → GEHC). He will care less about fancy architecture diagrams and more about: *How do you know it works? What did you test? What broke? How did you debug?*

2. What this means for a real Round I

Likely shape INFERENCE: intro → LogiFlow ownership → “how did you test / debug” → edge cases on Composer/SSE → light OOP or coding → why GEHC → your question.

Lead with

- What **you** owned: Route Composer, SSE, decision-intelligence
- One concrete bug + how you found it
- API contracts / integration checks
- Honest “I have not used Selenium; closest is ____”

Avoid

- Claiming Selenium/Cucumber you never used
- “We didn’t need tests — it worked in demo”
- Architecture theatre without failure modes
- Mentioning his LinkedIn tooling

YOU SAY

If automation comes up: “I have not written Selenium or TestNG suites. On LogiFlow I validated with API contract checks, manual edge cases on compose/SSE, and debugging live stream failures. I am ready to learn Java-based automation on the job — my closest base is Python + API testing habits.”

Ask him (pick 1): “On a healthcare product team, what does a strong intern look like in the first two weeks — writing feature code, or pairing on test design?” · or · “When you automate around medical software, what do you protect first — functional paths or safety/regression suites?”

Interviewer Brief — Venu S

For Karanbhai Bheda · EID Software · resume-aligned

Test panel

Quality focus

Public-web only. No Glassdoor/AmbitionBox/GFG review names him. Use this to choose what *you* lead with — never to show off research.

Who he is (one screen)

Staff Test Engineer, GE HealthCare Bengaluru since Jul 2023. Before that: Siemens / Siemens Healthineers test automation (~2018–2023), Capgemini, TCS. Self-describes as automation expert across **banking/finance and healthcare**, deep **Core Java**, Selenium / Itko Lisa / Squish, JUnit / Cucumber / TestNG, and building **data-driven frameworks from scratch**.

Career timeline → what it means for you

Period	Role	Implication for Karan
2023 → now	Staff Test Eng, GEHC	Knows GEHC quality bar; healthcare software must be verifiable
2021–23	Sr Test Eng, Siemens	Product-company testing discipline
2018–21	Sr Test Eng, Siemens Healthineers	Medical-tech domain years — reliability language scores
2017–18	Capgemini automation	Services-era automation delivery
Earlier	TCS automation	Long automation career, not a fresh SDE interviewer

How to pitch (resume-aligned)

- LogiFlow ownership** — Route Composer, SSE streaming, decision-intelligence (priority-weighted + Pareto). Full-stack FastAPI + Next.js.
- Lifecycle habits** — scoping, API contracts, Cloud Run / Vercel deploy paths, docs (on your resume — defend them).
- Testing story** — how you validated compose legs, stream disconnects, ranking edge cases. One real bug.
- Personifyw intern** — train/eval/debug TensorFlow models; systematic iteration.
- EasyBook / Beneath The Blue** — only if asked; show end-to-end shipping.

YOU SAY

Good morning sir, I am Karanbhai Bheda, second-year B.Tech Artificial Intelligence at SVNIT Surat, CGPA 8.75. On LogiFlow — Google Solution Challenge 2026 — I owned the Route Composer, SSE streaming, and decision-intelligence flows on FastAPI and Next.js, including live progress updates for multimodal itineraries. I also interned at Personifyw building and debugging TensorFlow models. I want the GE HealthCare EID Software internship because I want to write code that is tested hard enough for clinical settings, and grow toward EEDP.

Bridge to his world without naming him: “In logistics a wrong ranking wastes money. In healthcare a wrong path can waste trust — so I care about contracts, edge cases, and being able to reproduce a failure.”

EID Interview Prep — Karan

Question bank + model answers for a Staff Test Engineer panel

LogiFlow

Testing stories

Honest boundaries

Slot mindset. Staff Test Engineer panel → quality language wins. Stay inside the resume: Composer · SSE · decision-intelligence · FastAPI · Next.js · Redis · Cloud Run/Vercel · Personifwy · EasyBook · Beneath The Blue · BIS.

Resume claim card (do not invent)

Claim	Defend with
Route Composer	Chained multimodal legs; normalize pipelines; budget/timeouts
SSE streaming	Live progress; reconnect / partial failure behaviour
Decision-intelligence	Priority weights; Pareto / cheapest-fastest-safest; plain-language explanations
Cloud Run / Vercel	On your resume — say what you touched (env, smoke, logs), not knobs you didn't set
Personifwy	TF models: classify/detect; preprocess → train → evaluate → debug
CGPA 8.75 · 2024–28	Second-year AI, SVNIT

Question bank (test-engineer flavoured)

Q. Walk me through LogiFlow — what did you personally own?

YOU SAY

Multimodal logistics platform for road/rail/air/water/hybrid. I owned Route Composer (chained itineraries), SSE for live progress, and decision-intelligence scoring — normalize pipeline outputs, rank under user priority, surface cheapest/fastest/safest. FastAPI backend modules + Next.js integration. Team placed in Google Solution Challenge 2026.

Q. How did you test the Composer / streaming path?

YOU SAY

Three layers. (1) Contract checks — response schema after normalizing legs. (2) Manual edge cases — identical source/destination, missing mode, timeout mid-compose, client disconnect during SSE. (3) Debugging with logs when a leg failed but the stream stayed open. I have not built a Selenium suite; this was API + integration validation under a hackathon timeline.

Q. What broke, and how did you debug it?

YOU SAY

Pick one true story: e.g. SSE client saw a hung progress bar because an upstream leg timed out without emitting an error event — fixed by always sending a terminal error/complete event and tightening per-leg timeouts. Show: reproduce → isolate → fix → retest.

Q. You listed Cloud Run. What does that mean for quality?

YOU SAY

Stateless containers — smoke the health endpoint after deploy; check env/secrets not baked into the image; watch logs for 5xx on compose. I will not invent concurrency numbers I did not configure. Closest ownership: deploy path awareness + verifying the live API after ship.

Q. Difference between unit, integration, and end-to-end tests?

YOU SAY

Unit — one function/class in isolation. Integration — Composer + cache/API boundaries. E2E — browser or full path through UI to ranked result. On LogiFlow under time pressure I leaned on integration + manual E2E; I know healthcare teams push automation further, and I want to learn that.

Q. Have you used Selenium / Cucumber / TestNG?

YOU SAY

No. Honest boundary. Closest: systematic test cases for APIs, schema checks, and regression of compose scenarios after changes. Core idea of data-driven tests — table of inputs and expected ranks — is something I can transfer; the Java tooling I would learn on the job.

Q. OOP in C++ — polymorphism / virtual — why care for testing?

YOU SAY

Interfaces let you swap a fake dependency in tests. Virtual dispatch is how the real type runs under a base pointer — same idea as mocking a route provider behind an interface so Composer tests don't hit live TomTom every time.

Q. Why GE HealthCare / EID?

YOU SAY

I want software where testing is not optional — clinical settings need reproducible behaviour. EID is a live engineering project with a path to EEDP. I bring full-stack shipping habits from LogiFlow and want to grow under healthcare quality standards. Bengaluru: yes, no constraints.

Light coding (EID pattern)

Be ready to wrap Easy DSA in a class (PCON EID pattern): `TwoSumSolver.solve(nums, target)`, or tree leaf-sum with a `TreeNode` class. Narrate tests: empty, duplicates, negatives.

Night-before checklist

- Intro 45s · Composer/SSE pitch 60s · one bug story 45s
- Numbers you will not invent; tools you will not fake
- One question for him (testing/intern onboarding)

Mock 1 — Venu (Test Engineer)

20 minutes · ownership · debug · honesty

Timed mock 20 min

How to use. 20-minute timer. Read Venu's line aloud. Answer green boxes from memory. This mock assumes a *Staff Test Engineer* panel — quality, debugging, ownership.

Clock	Phase	Job
0:00–2:00	Open	Intro · stop cleanly
2:00–8:00	LogiFlow ownership	Composer · SSE · decision-intelligence
8:00–13:00	Test / debug deep-dive	How you validated · one failure
13:00–17:00	Fundamentals	OOP or Easy DSA in a class
17:00–19:00	Fit	Why GEHC · Bengaluru
19:00–20:00	Close	Your question

VENU Good morning. Tell me about yourself — keep it under a minute.

YOU SAY

The resume intro: second-year AI SVNIT, 8.75 CGPA, LogiFlow ownership (Composer, SSE, decision-intelligence), Personify TensorFlow intern, seeking EID Software → EEDP. Then stop.

VENU LogiFlow — what exactly did you build?

YOU SAY

Route Composer for chained multimodal legs; SSE so the UI sees live progress; decision-intelligence to normalize pipeline outputs and rank under user priority (cheapest / fastest / safest) with explanations. FastAPI modules + Next.js wiring. I don't claim I wrote every mode pipeline alone.

VENU If I give you a compose request that hangs for the user, how do you investigate?

YOU SAY

Reproduce with the same payload. Check whether SSE events stopped or a leg never returned. Inspect server logs for timeouts/exceptions. Verify per-leg time budgets. Confirm the client handles a terminal error event. Fix the missing event or timeout, retest the same payload, then a regression case that used to pass.

VENU Have you automated UI tests?

YOU SAY

No, sir — not Selenium or Squish. Closest is API-level checks and manual UI verification of booking-style flows on EasyBook and LogiFlow maps. I understand page-object style automation conceptually; I have not shipped it. I would learn the team's Java stack properly rather than bluff.

VENU Small OOP ask: why would a test suite prefer depending on an interface?

YOU SAY

So I can inject a fake route provider and test Composer without live network calls — faster, deterministic, no quota burn. Same idea as polymorphism: callers depend on behaviour, not the concrete class.

VENU *Why GE HealthCare?*

YOU SAY

Healthcare software is judged by whether it survives verification, not only whether the demo looks good. That matches how I want to grow — EID project work under real quality standards, path to EEDP. Bengaluru is fine.

VENU *Questions for me?*

YOU SAY

“For an EID software intern on your team, is the first win usually a feature slice with tests, or helping extend an automation suite?”

Pass bar: clear ownership · one real debug story · honest “no Selenium” · no invented Cloud Run knobs · stopped talking on time.

Mock 2 — Classic Campus

OOP + Easy DSA in a class + resume probe

OOP

Two Sum class

Classic campus pattern coverage: OOP + Easy DSA in a class + resume probe + light DBMS/OS. Still keep Venu's testing lens in mind if he sits this shape of round.

Clock	Focus
0:00–2:00	Intro
2:00–8:00	C++ OOP (virtual, copy ctor, overloading vs overriding)
8:00–14:00	LogiFlow / EasyBook drill
14:00–18:00	Two Sum inside a class + test cases
18:00–20:00	Why GEHC · close

VENU *Introduce yourself.*

YOU SAY

Karanbhai Bheda, B.Tech AI SVNIT, CGPA 8.75. C/C++ and Python. LogiFlow — Composer, SSE, decision-intelligence — Google Solution Challenge 2026. Personify AI intern. EasyBook MERN; Beneath The Blue Web Wonder finalist. Comfortable subjects: DSA, OOP, OS, DBMS.

VENU *What is a virtual function? Why a virtual destructor?*

YOU SAY

Virtual → runtime dispatch via vtable so the derived override runs through a base pointer. Virtual destructor → deleting derived through base pointer runs the full destructor chain; without it you leak/partial-destroy.

VENU *Implement Two Sum — but as a class method.*

YOU SAY

```
class TwoSumSolver { public: vector<int> solve(vector<int>& nums, int target); }; Hash map value→index; one pass. Tests: empty; no pair; duplicates; negatives; single element.
```

VENU *EasyBook — what would you test before a demo?*

YOU SAY

Auth session expiry mid-booking; double-submit seat select; sold-out race; mobile layout; API 401/500 handling. Same habit as LogiFlow: list failure modes before the happy path.

Close: Thank him; one question about intern quality expectations; do not ask “how did I do?”
